

ASSIGNMENT II

VANILLA

WALKING CYCLE

Prepared By:
Dulce Herbst-Aylesworth
July 2026

I. ANIMATION OVERVIEW

This month I was a bit more chill with myself so I decided to focus only on a vanilla walk instead of pushing myself to a more complicated walk.

II. ISSUES FOUND

- It was definitely way more complicated than I thought to control all the small controllers everywhere. For the ball and tail I was able to just key frame the entire model and have a better kinda guide for the other controllers - but for this one, that was a big mistake. It made the whole model feel and look very robotic and it was hard to bring him back to human. A disaster.
- Once I was able to make it feel a bit more normal, I started moving the wrong controllers again and it became another kind of disaster. The clavicles started feeling all weird and got all misshapen. I was very angry with this but I ended up going to Mixamo and other 3D animation references. That helped a lot.

III. WHAT I LEARNED

- I think I like animation more now that I understand how a human rig would work. It was definitely a lot of information given but I think I'm in a good spot and I can easily understand how to accomplish certain animations.
- I think I'm on better terms with the graph now. I understand a bit better what each option does and how "pretty" it has to look. Also it seems a bit easier to control the animation directly on the graph rather than a keyframe. Weird.

IV. REFLECTION

I am looking forward to next month, truthfully. I really would like to make a Sailor Pluto transformation sequence at some point, that would be insanely fun. It is definitely a bit frustrating and takes an insane amount of time, but I actually had a lot of fun and I now understand when you said that you get in the zone when animating. Oh yeah this one also reminded me to trust the process... once again lol.
